- Excel

EDUCATION

Alchemy Code Lab - Full Stack
Software Development with Web
Applications

PROFILE

Full-Stack Software engineer who finds great pleasure in creating elegant solutions for the worlds software needs. I live every day to work and interact with people. I truly believe two minds working together are greater than one and I am looking forward to collaborate with a great team.

PROJECTS

Slack Meetup Bot

This backend project was created in hopes of providing a more social aspect for finding meetups. It displays who in the channel signed up for what meetup so you can decide if you want to go with or avoid your friends.

- Cheerio NPM package to scrape a website to get all the meetups
- Slack API to create the meetup bot which responds to users commands
- MongoDB to store the current meetup data, and user data
- REST Api, using express and MongoDB
- Aggregations for the various routes

github.com/team-eldapa/slack-meetup-bot

Kanbanify - Trello Clone

This is a project management app that allows users to create workspaces and specific tasks to distribute work efficiently. Cards with tasks can be moved around from one board to another with menu commands. You can also add collaborators to workspaces so they can contribute to projects.

- Firebase used as database to store all the data
- User could login using google, or regular email
- Manipulated non-relational firebase data
- Vanilla JavaScript and heavy Component structure for the whole app
